if the exposed worker is part of the healthcare team, he/she may have access to the medical record and know the HIV status of the source patient, as well as information about drug resistance.

The nature's bounty version works just as well, but costs a little more.

The numerator equals the cost of delivering the intervention minus the medical costs saved by preventing the transmission of HIV and other economic benefits of prevention.

(p < 0.04), (p < 0.014)
