of these, 206 had what would meet the doctor's criteria for "low risk disease". But Gallagher and colleagues' work showed that hyperactivity in the brain was instead causing it to atrophy.

Serious complications are based on how often adult patients had certain serious, but potentially preventable complications related to medical or surgical inpatient hospital care.

Part of the problem may well be that the VA has little incentive to change, given the fiscal windfall accrued from dispensing psych drugs—particularly when compared to unprofitable alternatives.
